

EEPROM variables and layout

EEPROM 8-bit Empty value = 0xFFh 255

EEPROM 16-bit Empty value = 0xFFFFh 65535

Italic = unused or default

Bold = Status

In Default/FactoryReset column the

- **L** Language
- **S** Statistics
- **P** Shipping prep
- **S/P** Statistics and Shipping prep

will overwrite existing values to 0 or default. A FactoryReset All Data will overwrite the whole EEPROM with ffh and some values will be initialized automatically, others need a reset / reboot.

How can you use the debug codes?

- Serial terminal like Putty.
- Octoprint does support D-codes
- *Pronterface* does **not** support D-codes

!!! D-codes are case sensitive so please don't use upper case A,C or X in the address you want to read !!!

Useful tools/links:

To convert hex to ascii <https://www.rapidtables.com/convert/number/hex-to-ascii.html>

To convert hex to dec <https://www.rapidtables.com/convert/number/hex-to-decimal.html>
